

Project Design Phase-I Solution Architecture

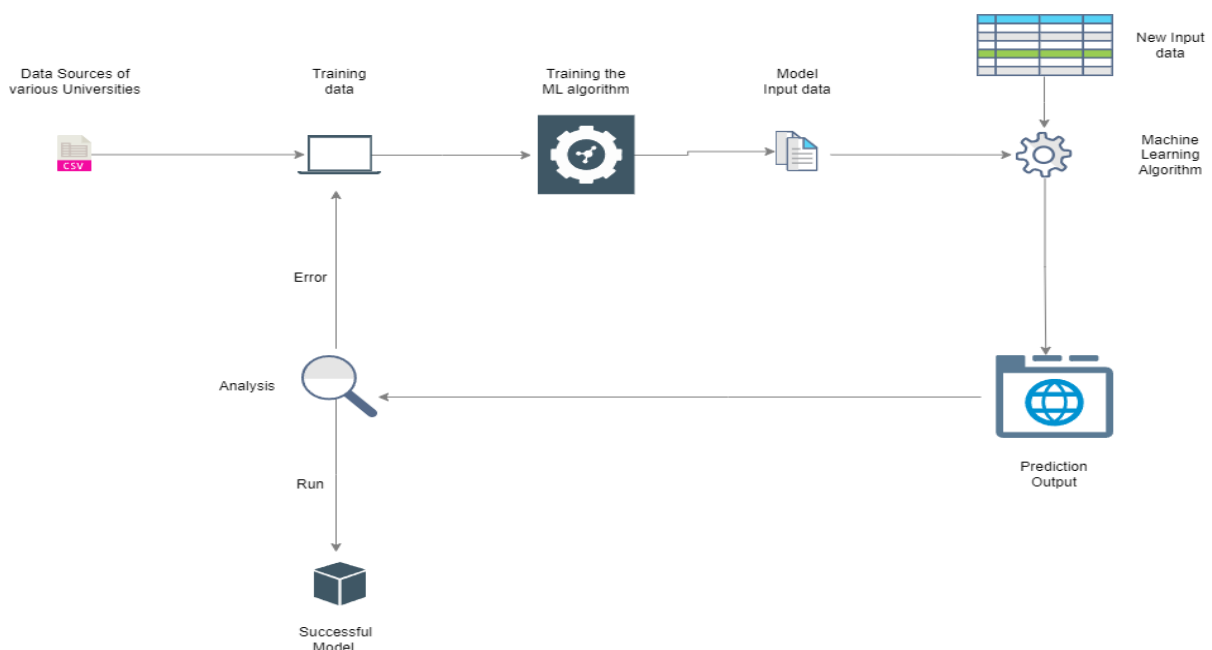

Date	5 October 2022
Team ID	
Project Name	University admit eligibility predictor
Maximum Marks	

Solution Architecture:

Solution architecture for the university admit eligibility predictor description as follows as:

- First the data sources of various universities are collected with the open-source platform integration.
- The data's are pre processed and cleaned for the training.
- The machine learning algorithm is decided to train the datasets.
- Model input data is generated by the continuous training.
- For the upgradation of the prediction model the new dataset's are integrated at the regular intervals for trending university lists.
- The models are trained and tested with the higher accuracy and precision until the final successful model is build.
- As the final output prediction is done by the desired output

TITLE: UNIVERSITY ADMIT ELIGIBILITY PREDICTOR SOLUTION ARCHITECTURE

Architecture and data flow of the university admit eligibility predictor application
